

Release Notes [Print](#)

Modified on: Tue, 17 Dec, 2024 at 2:59 PM

Releases featuring changes to the simulation engine can affect case outputs. Releases affecting output calculations will be marked in the release info

Release dateDecember 16, 2024

Where	What
	Statistical

DashboardThe dashboard is now split in two tabs; one tab for the data that is sampled across all runs (Statistical), and one tab with the data from a specific run picked

PS! This feature is only used for construction cases for now, which use specific runs to display timeline data (S-curve and inventory st

Percentile

Sort by

P50

ProjectTask-group

Simulation runs are based on the selected percentile value, projects or the selected task group duration. Run data cont task groups and the entire campaign timeline.

Dashboard

For run based data you're able to control what the runs are ranked based on with this feature. By default it still ranks runs based on the duration of the whole any of the tasks you add to your assets in the case.

Example
E.g. in a project with installation and subsequent commissioning you can rank runs based on installation end date instead of project end

Dashboard

Each chart now have an info button where you can find a definition of what the chart shows.

Release nameAdvanced modeling capabilities for Towing vessels
Release DateNovember 21, 2024

Logistic Lead Time Inputs for Towing Vessels

Con 3, O&M

Charter starts after vessel's lead time in Design Shoresim

- Vessel charters now span multiple work orders without requiring lead time resets after each round trip.
- Lead time applies only at the start of the charter period, enabling uninterrupted operations.

Continuous Towing in/out modeling

Users can now model a scenario where Towing vessels towing an asset back to the wind farm can pick O&M up another for MCR during the return trip.

Enable this feature by selecting the new **"Allow Continuous Disconnection"** option on towing vessel instances

Allow continuous disconnection

Settings

Availability

Always available

- Shoresim now prioritize **available chartered vessels** before initiating new charters, reducing redundancy and costs.
- Vessel charters remain active during towing-in and towing-out phases to avoid operational gaps.
- Enhanced coordination for multiple towing vessels ensures charters end only after their respective operations are complete.
- Towing operation days are calculated only for the period between **mobilization and demobilization**.

Headline	Description	Shoreline Product O&M
New corrective maintenance tab	As part of ongoing efforts to improve user experience, performance, and scalability, the Corrective Maintenance tab - Design O&M has been updated with a modernized layout.	

Key Enhancements:

- Data has been migrated 1:1 from the old framework to a new, modern framework.
- All input data and core functionalities for corrective maintenance remain the same
- The updated design delivers a more intuitive and visually modern experience with consistency in design and workflow.

No tasks found

No tasks have been added yet.

+ Add new task

Expected Benefits:

- Users will experience improved performance within the Corrective Maintenance tab.
- This release lays the groundwork for further enhancements to scalability and usability, with additional improvements planned in upcoming releases.

We hope these changes contribute to a smoother and more efficient experience on the platform. Please reach out to the support team with any feedback or questions regarding this update.

Planned improvements in future releases:

1. Users will only be able to save new tasks in the Corrective Maintenance tab once all required inputs are completed and validated for each task. Currently, the error notification does not indicate which specific tasks or fields need correction. In the next release, this will be improved to provide more detailed guidance for user corrections.
2. Improvement in general error and warnings notifications

Helicopter - day light restrictions

Users can now toggle the daylight restriction setting on or off under the **Weather Criteria** tab for helicopter logistics.

Con 3, O&M

- **Default Setting:** ON, maintaining the current daylight restriction application.
- **New Option:** OFF, allowing helicopter operations based solely on weather conditions, independent of daylight restrictions.

Design v3.50.0

Release date

October 26th, 2024

Headline	Description	Shoreline product
Feeder logistics utilization	We resolved a minor bug causing inconsistencies between the report and dashboard for feeder utilization, where the report displayed the correct utilization but the dashboard chart incorrectly showed it as 0	Construction 3

Release version

Design v3.49.0

Release Date

October 7th, 2024

Headline	Description	Shoreline Product
Feeder scenario modeling enhancements for Wind farm construction projects modeling	We are pleased to announce the launch of the Enhanced Feeder Modeling feature in our Design Construction software. This update introduces the ability for feeders to remain offshore for extended periods, delivering multiple assets sequentially to installation vessels with limited space. The new capabilities aim to enhance operational planning, improve installation workflow, and optimize feeder/barge usage in offshore wind projects.	Construction 3

Key Benefits:

1. Feeders now have the ability to carry multiple components simultaneously and deliver them one at a time as installation vessel deck space becomes available in the case.

2. Feeders can stay offshore longer, reducing the need for frequent returns to port, which lowers fuel costs and increases efficiency in the simulation model.

Technical Overview:

- We've added a "Maximum capacity per transfer to HLV" field to define how many components a feeder can deliver in one trip. If more tasks remain, the feeder will automatically move to the next location and await further transfers.

Practical application

- **10 Knot Speed Restriction:** Model the 10-knot speed restriction for the first 30 nautical miles outside the US coast, meeting US developers' requirements.
- **Helicopter Routing:** Differentiate helicopter routes from sailing routes, addressing longstanding industry demands.
- **Heavy Lift Vessels (HLVs):** Plan different routes for HLVs entering and exiting harbors to minimize delays.
- **Onshore Transportation:** Enhance modeling for specialized trucks, such as those transporting nacelles and blades.
- **Floating Wind:** Distinguish between towing routes for semisub tows and regular sailing routes.
- **Long Voyages:** Plan distinct routes to ports and fabrication yards, considering cost-effective options like avoiding the Suez Canal.

Start exploring the advanced modeling capabilities with Shoreline Design!

Release date	24 September, 2024		
Feature	Logistics Charter and Lead time management for O&M Major component repair modeling		
Logistics charter and Lead time management	Headline	Description	Shoreline product
		<p>This is one of the important updates to our Logistics charter management in O&M. This will optimize logistics lead times and charter periods, to enable users to be able to model the practical needs of real-world operations.</p>	
		<p>Key Improvements:</p> <ul style="list-style-type: none">• Shoresim, the simulation engine, will allow a logistics charter period to cover multiple work orders without needing a lead time reset after each trip. Once a vessel is chartered and available, it remains ready for subsequent tasks until all assigned work orders are completed.• Previously, each roundtrip triggered a new lead time before the vessel could begin the next task. With this implementation, lead time is only applied once at the start of the charter period, enabling continuous, uninterrupted operations.	Applicable for major component replacement corrective maintenance tasks (HLV)
		<p>Now, chartering logistics ensures full utilization during the contracted period. The logistics will transition from one work order to the next, maximizing efficiency and reducing idle time.</p> <p>Benefits:</p> <ul style="list-style-type: none">• Reduced Operational Downtime: By eliminating unnecessary lead time resets, vessels can now operate continuously, minimizing delays between tasks.	O&M
		<p>Please note that Charter starts after Logistics's lead time in Design Shoresim</p>

Con 1, Con 3

Route planner
enhancement

- All dedicated Crew Transfer Vessels (CTVs) accompanying the Heavy Lift Vessel (MCR HLV) will now follow the designated CTV logistics route as set in the route planner feature.
- Previously, sometimes logistics entered the wind farm from the south side. With this release, all logistics will directly approach the wind turbine for operations and maintenance.

Con 3, O&M

PBA loss per root cause
enhancement

- The internal function related to the calculation of PBA (Production-Based Availability) loss root causes has been updated. However, there will be **no changes** to the calculation results.
- Prior to this release, there were instances where, apart from the work shift, the simulation categorized loss per root cause as part of the full-day in-route logistics instead of weather delays. This primarily occurred when moving from inspection to preparation stages.
- After this release, these losses will now be correctly categorized under **major weather delays**, rather than **major response time delays**.

O&M

Headline

Description

Shoreline Product

The PBA Loss Root Cause chart's downloadable sheet is now integrated into the main Output report, saving users time and eliminating the need for additional downloads.

Dynamic Power Adjustment

User can simulate real world scenario to prevents overloading of the power transport infrastructure with this implementation to reduce WTG power production when the associated cable or Offshore Substation (OSS) reaches its maximum power capacity or encounters a failure.

Impact of BOP on Production-Based Availability (PBA)

Users can simulate failures of cable, OSS, and foundations impacting wind farm power production and analyze the influence of foundations, cables, and OSS BOP components on the PBA outputs.

Key metrics				
Summary				
0.76 % TBA Loss	1.15 % PBA Loss	20,989,844.79 MWh Total actual production	244,090.55 MWh Lost production	35,008.4 Hours Downtime
46.12 % Gross capacity factor	45.61 % Net capacity factor			

Please note:

- You can also add foundations to your case that impact power production by adding them as related instances to the relevant asset.
- If you don't add cables to your case with power capacity inputs, the wind turbines in your case will generate power according to the windspeed and WTG power curve.
- If you only have an OSS and no cables, the OSS will reduce energy production on every WTG in the wind farm to which it is connected according to the percentage you set on the maintenance activity.
- Finally, if you want cables in your case without them influencing site-wide power production, you can add the cables to your case without linking them to an asset.

Detailed steps for Wind farm reliability modeling is available [here](#)

PBA loss root cause:

Users can now find long weather delays categorized under the Major weather delay category in the PBA loss root cause.

Improvement

TBA calculation:

With this release, Users can see TBA outputs based on the impact of Wind turbines only. BoP assets will not have any influence on TBA calculations.

4. Personnel utilization total for each personnel group

- 5. Total Production (MW/GW)
- 6. TBA loss
- 7. 100% - TBA for full simulation (all years and all wind farms)
- 8. PBA loss
- 9. 100% - PBA for full simulation (all years and all wind farms)
- 10. Lost production for full simulation (all years and all wind farms)
- 11. Downtime hours for full simulation (all years and all wind farms)
- 12. Gross capacity factor
- 13. Net capacity factor

Output Dashboard - Download options enhancements, Simulation log downloads

Added the ability to download simulation logs on the new output page.

- Log Naming and Structure:**
 - Logistics Log: Renamed as "Transfer task log" for Con 3 and "Transfer work order log" for O&M.
 - Raw Log: Renamed as "Task status change timestamp log" for Con 3 and "Work order status change timestamp log" for O&M.
 - Visualization Log: The "Visualization log" remains for both Con 3 and O&M.

29 April 2024

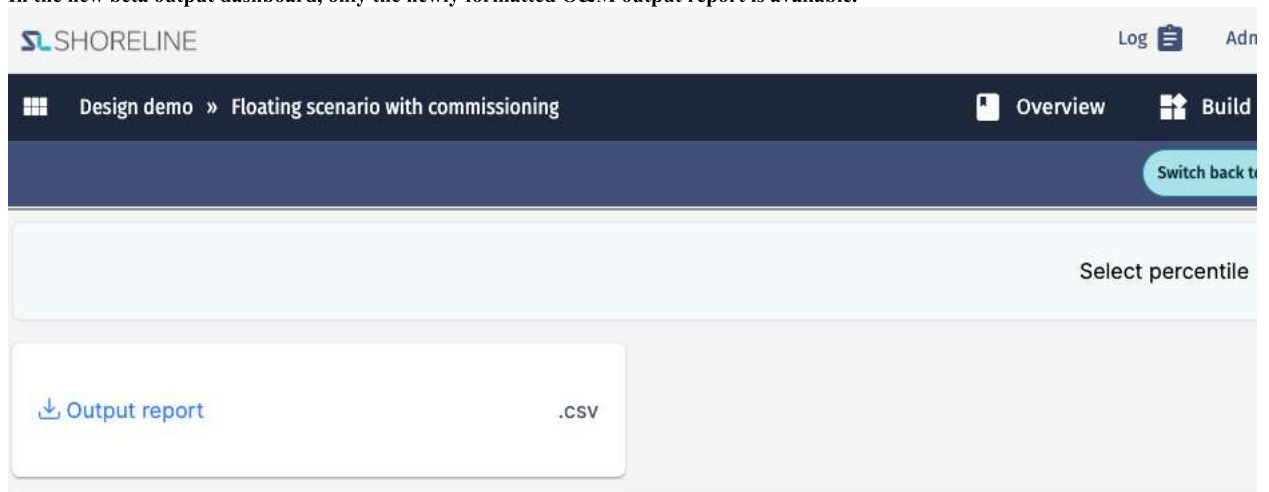

09:24

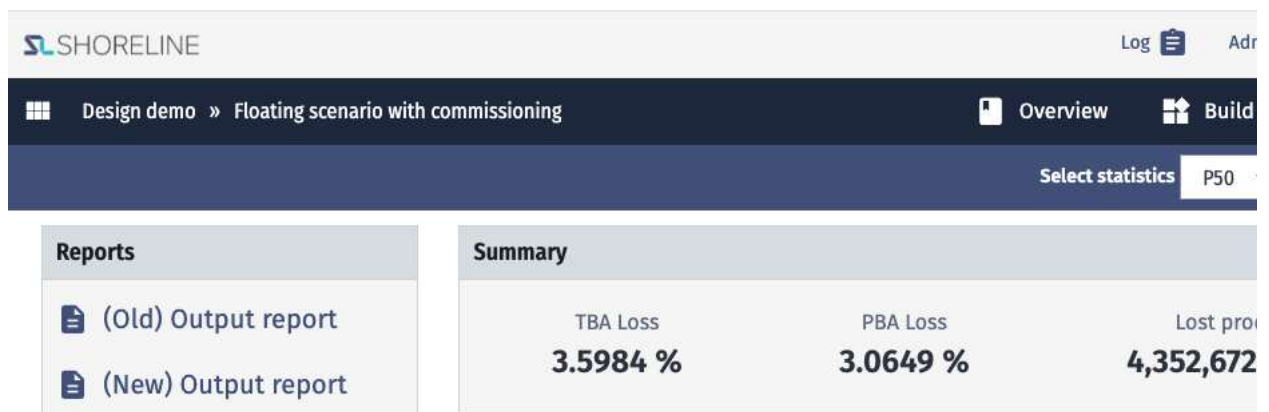

Headline	Description
	Our O&M Output report undergoes a significant makeover, providing a renewed format for easy processing. Users will find the data more accessible and easier to process.
	Improvements in the new report
	1. Removal of empty columns/rows
	2. Uniform structure
	3. Compatible data layout
	4. Data accessibility

In the new beta output dashboard, only the newly formatted O&M output report is available.

New output report for O&M [O&M Output report - Detailed dive demo](#)

Both existing and new O&M output reports are available in the existing output dashboard.

New outputs to O&M report [O&M output -](#)

1. Weather-downtime-causes report
2. Logistics transfer utilization: count – Asset drop off /pick up
3. Personnel time spent outputs
4. Case inputs – logistics and more

Headline

Description

New dashboard view: Chart - Task group duration

The new Task Groups end-time graph will allow users to see the completion date of each group of tasks for different percentiles. We will improve the visualization of this chart in the subsequent releases

Average task duration per task group - Output report

Users can now find the output data for average duration of a task from a Task group

Users can now generate a comprehensive report detailing important case input parameters or configurations for a case model. This feature enables users to export the data to a CSV file, providing a detailed overview of the model's configuration and input parameters. This report is particularly useful for documentation and sharing model settings with other users or stakeholders. The report is generated directly within the Design application, streamlining the workflow and ensuring that all relevant information is captured and accessible.

Case Inputs - Output Report

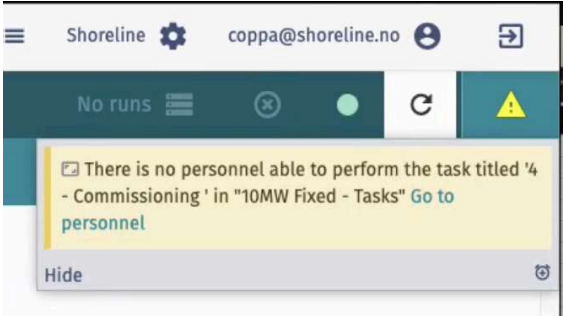

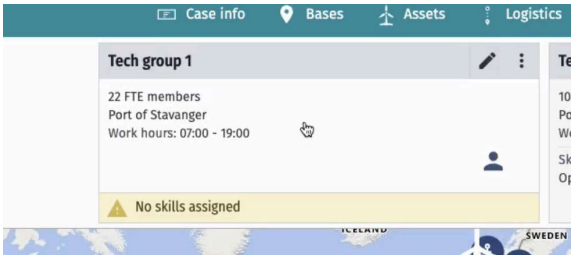

Next iterations - Will be available for O&M in subsequent releases

**Input Library
access**

The customer Account Admin role can now have the highest permission access to all templates in the input library, streamlining template management.

Enhanced Skill Validation for Transfer Tasks

Modelers will now receive notifications if they forget to set required skills on transfer tasks or omit these skills from personnel groups. Additionally, modelers can now select personnel with the required skills and consider vessel transportation capabilities for the tasks.

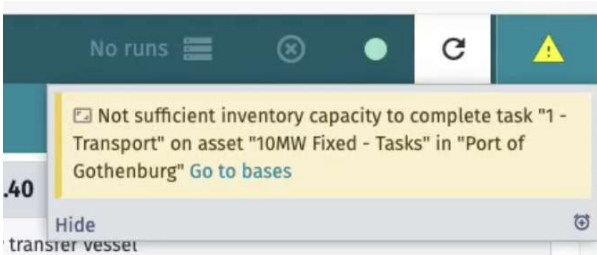

Task and Personnel Group Validation

Users editing tasks on assets or personnel groups will be prompted to add necessary skill groups or skills, respectively, before saving changes. Sets assigned to transfer tasks that have not been allocated to any personnel group.

Implemented a validation check to address simulation failures from vessel capacity exceeding port capacity. Users will now receive an error on simulation failure.

Case validation to check vessel vs. Port capacity - Inventory

The asset access limitations settings can now be modeled for Crew transfer vessels to improve case accuracy.

More weather criteria inputs on CTV

- Wind speed access limit values in m/s (similar to SOV)
- Wind speed limitation reference height in m (similar to SOV)

Headline	Description
Additional route inputs such as Speed limit and Time Delays for Waypoints	Construction 3 & O&M We have added the ability to set speed limits (Max speed) at bases and the wait times ('Time delay') at each waypoint . This is an excellent addi

These local restrictions could include:

- Designated zone areas within the port (anchorage areas, gates, customs & security checkpoints)
- Environmental restrictions, e.g., whale movements, sea animals' mating season, etc.,
- Local laws to manage local community relations – e.g., as regards reducing noise and disturbance caused by fast-moving vessels

The impact of setting these restrictions can be viewed in the Visualisation Log and the visualization.

**Lead Time
for individual
vessel
instances**

In Shoreline Design, lead time is the amount of time needed to make preparations before a vessel carries out a task.

It was previously possible to set lead time for all the major vessels on the Strategy tab, which meant the same lead time was applied to all vessels. In reality, there can be a k

We're making some changes to the Design application's Output Dashboard for [Construction](#) and [O&M](#).

Check out the development by selecting to view the beta version.

Note: the Inventory Management graph can only be found on the beta dashboard.

Caution: The new output page is in beta and undergoing active development. You might encounter bugs and limited functionality.

In future releases during Q1, we will continue to add new output data (charts, widgets, tables) to the dashboard for both construction and O&M.

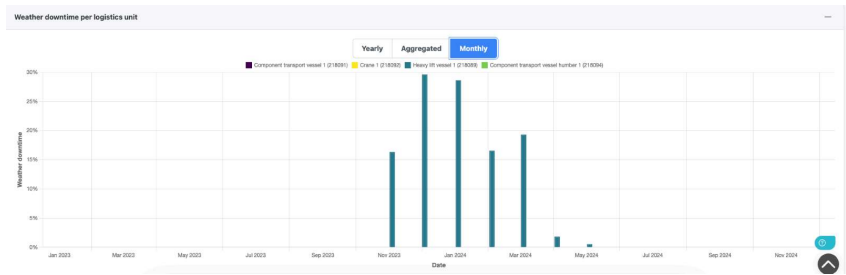

Highlights:

- The percentile selector applies to all items on the page, including the reports.
- All reports can be found at the top of the page.
- All graphs have zooming functionality, colors, and icons designed to improve readability and accessibility.

Construction 3

The 3 Weather Downtime per Logistics Unit graphs are now amalgamated into one, with tabs for Yearly, Aggregated, and Monthly. This reduces the clutter on the dashboard.

New Output dashboard

The Inventory Management graph is now on the beta dashboard and has improved visuals.

Process cycle We have [restructured the towing vessel process cycle](#) to optimize O&M specially for floating scenarios, enabling more efficient execution of towing vessel

- Enhancement and bug fixes
1. Tasks will now be completed if the Inspection, Preparation, Replacement, and Finalisation fields are empty or have a default value of 0.1
 2. Scheduled Maintenance recurrence should be based on the number of operational years.

Release Number
Release Date

Design v3.36.0
14.12.2023

Headline Description

- Optimization
- Improved process scheduling: Fix in response to user feedback regarding process initiation times. Previously, processes commenced on the hour minute discrepancies, especially within larger campaigns, this fix ensures that processes start the next minute following the previous process cycle.
- Bulk Edit permissions will be applied correctly without refreshing the page twice.

Enhancement and bug fixes

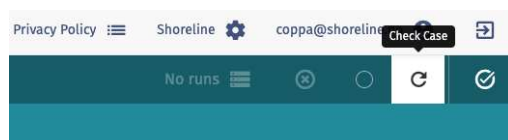

Enhancement and bug fixes

1. In cases involving feeder vessels for installation tasks, there was a minor bug causing them to go unreported in the process cycle log. We have successfully
2. Fixed the bug around cable installation vessel (CIV) capacity. The project timeline now accurately reflects CIV capacity

Release Number	Design v3.35.1	
Release Date	08.12.2023	
Headline	Description	Shoreline Design 1
Enhancement and Bug fixes	We have fixed a minor bug around vessel selection not replicated on copied case.	O&M

Release Number	Design v3.35.0	
Release Date	30.11.2023	
Headline	Description	Shoreline Design product (s)
	Design Construction: Inventory Management feature release	

	<p>Inventory Management is a feature that enables the users to strategically control every component in the construction of wind farm project simulation in Design software.</p> <p>Users can now model all the components required to construct a wind farm project on Shoreline Design, such as tower components, tower assemblies, nacelles, blades, and floating foundations.</p> <p>Port Capacity: The storage of components can now be modeled on bases, allowing users to itemize the exact number of each component that can be stored at each base. The flow of components between the manufacturing base, marshaling harbor, and wet storage can be easily tracked using the new Inventory Management graph on the Output page, and stock levels can be set to reflect real-world space limitations.</p> <p>Strategic movement of components: The movement of components can be modeled on transport tasks, allowing users to itemize what is being transported from one location to another and in which quantity.</p> <p>Complex assemblies and installations: The assembly of components, such as several tower components into a tower assembly, can now be modeled on an asset's tasks. This aids in greater visibility of what is being performed in each assembly and installation task and allows for modeling more complex scenarios, such as floating installations. Find out more about how Inventory Management can help:</p>	
New Feature	<p>Inventory Management</p> <p>1) We have now added more Statistical selector Percentile values such as Min, Max, 25, 50, 75 with the existing ones P10, P20, P30, P40, P50, P60, P70, P80, P90 are available in the project plan report the output report, Statistical p-Selector in the output dashboard.</p> <p>2) Users can now validate their cases using Check Case button. This triggers case checkers run on demand and notify all the errors and warnings under Notifications.</p>	Construction 3
Optimisation		Construction 3, O&M

3) We've integrated a permanent link within the Design application, allowing users to conveniently access release notes whenever they prefer.

Minor Changes

1. We have **removed MS Project and Primavera format Milestones and Process cycle Log** from **S-Curve download section**.

Construction 3

Enhancements and Bug Fixes

1. The users can export the assets without any error messages in O&M
2. The users can upload a corrective maintenance task without any errors in O&M
3. The user can save changes by clicking the newly added Save button at the bottom section of the Scheduled Maintenance task page in O&M.

Description

Shoreline Design product (s)

O&M - Corrective maintenance tasks

Design O&M

In a wind farm with Operations start year X+2 (X being the simulation start year), we have had a bug O&M where failure rates were not started X+2 but X. This has been fixed in this release.

Addressing Location Mismatches between Personnel and Vessels (CTVs and Helicopters Without Mother Vessels)

In our previous tool version, a discrepancy between personnel and vessel locations allowed the simulation to proceed, marking tasks as completed inaccurately. This occurred ONLY with CTVs and helicopters lacking a mother vessel. We've rectified this problem by implementing a fix, ensuring tasks progress only when the site/location matches. The simulation now correctly fails when there is a mismatch.

Construction 3, O&M

Enhancements and Bug Fixes

1. When multiple cranes work on the same assembly tasks, the simulation will run successfully without failing.
2. We have also improved our scheduling algorithm to handle the interaction between the daylight restriction of the helicopter and the personnel work shift.
3. Users can delete projects without any issues

Con 3, O&M

Headline	Description	Shoreline Design product (s)
	Project Plan Report - Managing wind farm simulation projects is now simpler and more insightful with the Project Plan Report. - Get a comprehensive view of your entire project timeline in one report. - Tasks are organized hierarchically and can be expanded or collapsed as needed using software like MS Project, Primavera P6(Oracle) - Visualize task hierarchies and dependencies effortlessly. - Make informed decisions and streamline project management. How to use: Project Plan Report document Date and Time Restrictions	

	- You can now specify certain timeframes during which logistics are unavailable for use on a project at a task's Process and Step level of logistics. - This feature empowers you to accurately represent real-world constraints within your projects. - Constraints may include Local Laws, Environmental restrictions, Cost reduction and financial planning, Authority body rules, and more. - Enhance your project modeling experience with unparalleled flexibility and realism How to use: Date and Time Restrictions document

Distances and Transit Times	Distances and Transit Times between port and wind farm, and between assets: All information which was available on the Cycle Overview tab on Construction 1 is now available on Construction 3 on the processes for each Logistic. More information can be found here.	Construction 3

In Construction 1 the Learning Curve indexes started from “1”. In Construction 3 they start from “0”. We have added some clarifying

Learning Curves

Construction 3

information in the product:

See the [Learning Curves page](#) for more information.

Bug fix

We continued work on the bug fix identified in 3.19 regarding limitations due to daylight restrictions.

Construction 3
O&M

Weather data

We have added weather data for South India.

Construction 3
O&M

Release number

3.19

Release date

27.04.2023

Headline

Description

Shoreline Design
products(s) affected

Some weather files (not ERA-5) contain data on daylight and lightning.

When these weather files are uploaded, historically both boolean values were registered for Lightning and for Limited by Daylight.

Bug fix

However for some time we have only been simulating on “it is dark” = 0 and “there is not lightning” = 0. This is a bug, which we have now fixed so that daylight and lightning are taken into consideration in the simulation.

Construction 3
O&M

We will investigate how long this has been a bug and the likely impact on customers' cases.
